

Eagle Green Care

Instructions for use

The environmental nematicide, designed to reduce and control all known damaging nematodes

- First – take soil samples from the area of green in order to ascertain what types and numbers of nematodes are present. Please note that each green must be sampled separately as nematode numbers and types could vary considerably between areas
- Prior to sampling ensure the soil temperature is above 10°C
- Make a note of the green number and position of samples taken, on the Eagle Green Care data sheets provided
- Send the samples off immediately to AFBI Belfast in the Eagle Green Care kit provided
- On receipt of the sample results, please refer to the label and consult your agronomist for the correct rates of Eagle Green Care to use and timing of applications
- After the last treatment of Eagle Green Care has been applied, re-sample the green approx 4-5 days later following the same procedure as above
- When the sample results have been received, discuss these with your agronomist for future treatment strategy.
- Up to 6 applications of Eagle Green Care may be applied during the season.
- REMEMBER – Eagle Green Care is totally safe to the operator and end user but deadly to nematodes!
