

NEMguard® granules

Instructions for use

Typical nematode symptoms and associated damage

Application Rate 20KG/HA

How to use

It is recommended the product is applied beneath the soil surface in bands at the same time as drilling. Apply as near to the seed as possible, through appropriate granular application machinery

Best conditions for NEMguard®

Soil should be considered damp enough to support seed germination at the time of a NEMguard application.

Percolation of water down the soil horizon is required to disperse the actives in NEMguard granules and loss of continuous hydraulic contact down the seed bed after application may adversely affect efficacy. If conditions are dry at application, 20 mm of irrigation should be applied as soon as possible after application. If dry conditions persist additional regular irrigation should be applied to reach a total of 80 mm by six weeks post drilling.

NEMguard treatments vs Vydate
